SEASONS
Session 1: Space-Based Perspectives

1. Draw a space-based diagram that shows why we experience day and night on Earth.

Make sure that you:

- Include all objects that you think are important to show your reasoning.
- Label the key parts of your diagram.
- Shade your diagram to show the unlit (nighttime) part.
- Draw a triangle on a location (a city) that is currently experiencing daytime.
- Draw an X on a location (a city) that is currently experiencing nighttime.
- Think about how a city like Boston experiences a day-night cycle. Add arrows to your diagram to show the movement of the Earth that explains why Boston experiences a day-night cycle. Think carefully about which direction things should move.
A. Make a prediction:

I think the Sun’s apparent path in the sky each day is \textbf{different} throughout the year.

\begin{itemize}
  \item If you think it is the same, explain \textit{why} it is the same.
  \item If you think it is different, describe \textit{how} it is different.
\end{itemize}

\begin{itemize}
  \item It is different each day because Earth’s fixed tilt of Earth changes the
  \item Earth-based orientation with the Sun as Earth moves around the orbital
  \item plane.
\end{itemize}

\begin{itemize}
  \item (But students won’t be expected to know that yet, this is just to collect their
  \item initial ideas.)
\end{itemize}
B. Collect data for Boston:

<table>
<thead>
<tr>
<th>Season and date</th>
<th>Marker Color (on SunTracker)</th>
<th>Sun Angle at Midday (in degrees)</th>
<th>Length of Day (in hours)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Winter (December 21)</td>
<td>blue</td>
<td>24°</td>
<td>9 hours</td>
</tr>
<tr>
<td>Spring (March 21)</td>
<td>green</td>
<td>48°</td>
<td>12 hours</td>
</tr>
<tr>
<td>Summer (June 21)</td>
<td>red</td>
<td>71°</td>
<td>15 hours</td>
</tr>
<tr>
<td>Fall (September 21)</td>
<td>black</td>
<td>48°</td>
<td>12 hours</td>
</tr>
</tbody>
</table>

C. Compare and analyze data for Boston:

1. Which season has the highest Sun angle at midday? **Summer**
2. Which season has the lowest Sun angle at midday? **Winter**
3. Which season has the longest day length? **Summer**
4. Which season has the shortest day length? **Winter**
5. Which seasons have the same Sun angle at midday / day length? **Spring and Fall**
6. Was the Sun ever directly overhead in Boston? **Nope**

D. Record your ideas:

How do you think the Sun’s height in the sky and the length of day affect temperature on Earth?

1. Here are some ways I think the Sun’s **height in the sky** affects temperature:
   
   Higher sun angles produce more concentrated light, resulting in more energy and higher temperature. (But students aren’t expected to know that yet.)

2. Here are some ways I think the **length of day** affects temperature:
   
   More hours of daylight mean light and energy transmit to a location on Earth for a longer time, raising the temperature. (Again, hasn’t been explained yet.)
SEASONS
Session 4: Sun Angle and Energy

Activity: Modeling Light from the Sun

In this activity you will use a flashlight and grid paper to model sunlight hitting the ground at different angles. You will explore how Sun angle affects the amount of ground illuminated by the Sun, which determines the amount of energy we receive from the Sun (and therefore, temperature).

A. Procedure:

1. Place the gridded paper on your desk. Place the bottom of the meter stick where the gridded paper tells you to.
2. Use a protractor (or half-SunTracker) to position the meter stick pointing straight up, at an angle of 90°. Turn off the room lights and turn on the flashlight. This represents a Sun angle of 90°.
3. Use a pencil to draw an outline around the area illuminated on the gridded paper. Label the outline with the current Sun angle.
4. Repeat step 2 at 60°, 30°, and 10°. Use your protractor (or half-SunTracker) to measure the angle. Keep the bottom of the meter stick on the bold line of the gridded paper for each trial.
5. Turn on the lights when everyone is finished.
6. For each Sun angle, count the number of squares illuminated by the flashlight, estimating if some squares are only partially lit. Record data in the table below.
7. For each Sun angle, determine the fraction of light striking each square and record it in the table. For example, if the flashlight illuminated 15 squares, then each square receives 1/15 of the light.

B. Collect data:

Complete this table with your group:

<table>
<thead>
<tr>
<th>Sun Angle (in degrees)</th>
<th>Number of Squares Illuminated (area in cm²)</th>
<th>Fraction of Total Light Received by Each Square (as a fraction)</th>
</tr>
</thead>
<tbody>
<tr>
<td>90°</td>
<td>Different for each group</td>
<td>Different for each group</td>
</tr>
<tr>
<td>60°</td>
<td>Different for each group</td>
<td>Different for each group</td>
</tr>
<tr>
<td>30°</td>
<td>Different for each group</td>
<td>Different for each group</td>
</tr>
<tr>
<td>10°</td>
<td>Different for each group</td>
<td>Different for each group</td>
</tr>
</tbody>
</table>
C. Compare and analyze:

At which Sun angle was the largest area of ground illuminated? 10°

At which Sun angle was the smallest area of ground illuminated? 90°

At which Sun angle did each square of ground receive the most amount of light (and therefore, the most intense light)? 90°

When sunlight is more intense, the temperature will be (warmer / cooler). warmer

At which Sun angle did each square of ground receive the least amount of light (and therefore, the least intense light)? 10°

When sunlight is less intense, the temperature will be (warmer / cooler). colder

D. Record your ideas:

Based on what we have learned so far, explain why you think it is warmer in the summer than in the winter.

Try to connect what you have learned about:
(1) how the Sun appears to move in the sky during different seasons;
(2) how the Earth’s axis affects the mid-day Sun angle; and
(3) how the Sun’s angle in the sky affects the intensity of light we receive.

It is warmer in the summer because the hemisphere is tipped towards the Sun, which results in a higher sun angle. Higher sun angles produce more intense sunlight, and therefore more concentrated energy (and warmth).
SEASONS
Session 5: Earth’s Tilted Axis

1. **Model a Year**

   Model Earth orbiting the Sun, using the Seasons sheet on your table as a guide.
   *Note: Be sure to always point your Earth’s axis in the direction indicated by the instructor.*

   ☐ Place your team’s Seasons Sheet on the table. Match the orientation of the seasons on the sheet to the signs hung around the room. Place a ring on the Seasons sheet. Place your Sun on the ring.

   ☐ Each team member should stand around your table at one of the season positions marked on the sheet. Each team member should represent a different season.

   ☐ Summer team member:
     - Hold Earth on the side of the Sun that represents Summer. Orient the tilt of Earth’s axis in the direction indicated by the instructor.
     - Holding the dowel that represents Earth’s axis, move Earth through your season to model how Earth orbits around the Sun during Summer.
     - Pass Earth to the Fall team member, always keeping the axis pointed in the correct direction.

   ☐ Fall, Winter, and Spring team members:
     - Take turns repeating the steps above during your season. Fall team member will model Earth’s orbit during Fall, then pass Earth to Winter team member, and so on.
     - Make to complete a full Year by passing Earth through every season and back to Summer.

2. **Model a Day at Different Times of Year**

   ☐ Summer team member: Rotate Earth at the Summer position, so your Lego person experiences both night and day. All teammates should make sure that the axis orientation remains correct.

   ☐ Fall team member: Rotate Earth at the Fall position, so your Lego person experiences both night and day. All teammates should make sure that the axis orientation remains correct.

   ☐ Pass and repeat for the other two seasons.

3. **Observe from the Model**

   When Earth experiences **Summer** in the Northern Hemisphere:
   1. The Northern Axis is tilted _____________ the Sun.
   2. The Southern Axis is tilted _____________ the Sun.
   3. To see the Sun at midday, Lego person must look _____________ , _____________ in the sky.

   When Earth experiences **Winter** in the Northern Hemisphere:
   1. The Northern Axis is tilted _____________ the Sun.
   2. The Southern Axis is tilted _____________ the Sun.
   3. To see the Sun at midday, Lego person must look _____________ , _____________ in the sky.
SEASONS
Session 6: Tilted Axis and Sun Angle

A. Interpret This Diagram:

1. The Northern Hemisphere is tilted away from the Sun.
2. Sketch in five light rays from the Sun, to show how you think sunlight reaches Earth.
3. Shade the diagram to show which part of Earth is dark.
4. What time of day do you think it is for the stick person above? midday
5. Circle which of the three figures below you think best represents the angle of sunlight hitting the person's ground at the moment shown above. The angle of sunlight is the same as the Sun Angle.
6. What season do you think it is for the stick person? winter
B. Interpret this diagram:

Diagram NOT to scale.

1. The Northern Hemisphere is tilted away from the Sun.  
   <towards / away from >

2. Sketch in five light rays from the Sun, to show how you think sunlight reaches Earth.

3. Shade the diagram to show which part of Earth is dark.

4. What time of day do you think it is for the stick person above? midday  
   <sunrise / midday / sunset / midnight >

5. Circle the figure that you think best represents the angle of sunlight hitting the person's ground (and therefore, the Sun in the person's sky) at the moment shown above.

6. What season do you think it is for the person? winter  
   <summer / winter >

C. Compare:

When the Northern Hemisphere is tilted towards the Sun, the Sun is high in the sky at midday. This is summer.  
<high / low >  <summer / winter >

When the Northern Hemisphere is tilted away from the Sun, the Sun is low in the sky at midday. This is winter.  
<high / low >  <summer / winter >
1. Sketch in five light rays from the Sun.

2. Shade the dark part of Earth.

3. What time of day is it for Person A? **midnight**

4. What season is it for Person A? **summer**

   Explain why you think so:
   
   It is summer for Person A because they are standing in the Northern Hemisphere, and this Hemisphere is currently tilted toward the Sun.

5. What time of day is it for Person B? **midday**

6. What season is it for Person B? **winter**

   Explain why you think so:
   
   It is winter for Person B because they are standing in the Southern Hemisphere, and this Hemisphere is currently tilted away from the Sun.
1. Sketch in five light rays from the Sun.

2. Shade the dark part of Earth.

3. True or False? Figure 1 and Figure 2 show the same time of day and the same season for Person A. __________

4. Sketch in a person for whom the Sun is directly overhead on this day. Label this Person B.

5. Sketch in a person who will never see the Sun on this day. Label this Person C.

6. Sketch in a person who will never experience darkness on this day. Label this Person D.
# SEASONS

**Session 7: Tilt and Day Length**

## 1. Collect Data: Total hours of daylight around the world

<table>
<thead>
<tr>
<th>A. The Northern Hemisphere is tilted <strong>toward</strong> the Sun.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&lt; toward / away from &gt;</strong></td>
</tr>
<tr>
<td>B. A place that spends this entire day in darkness (never sees the Sun) is <strong>McMurdo Station</strong>.</td>
</tr>
<tr>
<td>This place is in the <strong>Southern</strong> Hemisphere, close to the <strong>South Pole</strong>.</td>
</tr>
<tr>
<td><strong>&lt; Northern / Southern &gt;</strong></td>
</tr>
<tr>
<td><strong>&lt; North Pole / South Pole / Equator &gt;</strong></td>
</tr>
<tr>
<td>C. A place that spends less time in daylight than darkness is <strong>Puerto Montt</strong>.</td>
</tr>
<tr>
<td>This place is in the <strong>Northern</strong> Hemisphere, which is tilted <strong>away from</strong> the Sun.</td>
</tr>
<tr>
<td><strong>&lt; Northern / Southern &gt;</strong></td>
</tr>
<tr>
<td><strong>&lt; toward / away from &gt;</strong></td>
</tr>
<tr>
<td>D. The Northern Hemisphere is tilted <strong>away from</strong> the Sun.</td>
</tr>
<tr>
<td><strong>&lt; toward / away from &gt;</strong></td>
</tr>
<tr>
<td>E. A place that spends more time in daylight than darkness is <strong>Boston</strong>.</td>
</tr>
<tr>
<td>This place is in the <strong>Northern</strong> Hemisphere, which is tilted <strong>toward</strong> the Sun.</td>
</tr>
<tr>
<td><strong>&lt; Northern / Southern &gt;</strong></td>
</tr>
<tr>
<td><strong>&lt; toward / away from &gt;</strong></td>
</tr>
<tr>
<td>F. A place that spends the same amount of time in daylight as darkness is <strong>Quito</strong>.</td>
</tr>
<tr>
<td>This place is located near the <strong>Equator</strong>.</td>
</tr>
<tr>
<td><strong>&lt; North Pole / South Pole / Equator &gt;</strong></td>
</tr>
<tr>
<td><strong>&lt; &gt;</strong></td>
</tr>
<tr>
<td>G. A place that spends the entire day in daylight (never sees the Sun set) is <strong>Barrow</strong>.</td>
</tr>
</tbody>
</table>

| H. Barrow, Alaska spends **the same amount** time in daylight than darkness. |
| **< more / the same amount of / less >**                      |
| I. Puerto Montt, Chile spends **the same amount** time in daylight than darkness. |
| **< more / the same amount of / less >**                      |
2. Compare

A. When the Northern Hemisphere is tilted toward the Sun, the Southern Hemisphere is tilted _______ away from _______ the Sun.  
   < toward / away from >

B. Cities in the hemisphere tilted toward the Sun have _______ more _______ hours of daylight than darkness.  
   < more / the same amount of / fewer >

C. Cities in the hemisphere tilted away from the Sun have _______ fewer _______ hours of daylight than darkness.  
   < more / the same amount of / fewer >

D. Some places on Earth have roughly equal amounts of daylight and darkness every day of the year. These places are close to the _______ Equator _______.  
   < Equator / Poles >

E. There are places on Earth where on certain days of the year, the Sun never rises or never sets for an entire day. These places are close to the _______ Poles _______.  
   < Equator / Poles >

F. On September 21 and March 21, the total hours of daylight are _______ the same as _______ the total hours of darkness everywhere on Earth.  
   < more than / the same as / fewer than >
   These dates are known as the _______ Equinoxes _______.  
   < Equinoxes / Solstices >
SEASONS
Session 8: Earth’s Orbit

1. **What shape is Earth’s orbit?**
   
   A. Draw a diagram of Earth’s orbit around the Sun from an **overhead** perspective.
   
   B. Label all the key parts of your diagram.
   
   C. Label where you think Earth is when it’s September, December, March, and June.

2. **Distance from Earth to the Sun**

   Predict: In what month (if ever) do you think Earth is closest to the Sun? **December**

<table>
<thead>
<tr>
<th>Date (and season in Boston)</th>
<th>Collect Data distance from Earth to the Sun (in kilometers)</th>
</tr>
</thead>
<tbody>
<tr>
<td>December 21 Boston winter</td>
<td>147 million kilometers</td>
</tr>
<tr>
<td>March 21 Boston spring</td>
<td>149 million kilometers</td>
</tr>
<tr>
<td>June 21 Boston summer</td>
<td>151 million kilometers</td>
</tr>
<tr>
<td>September 21 Boston fall</td>
<td>149 million kilometers</td>
</tr>
</tbody>
</table>
3. **Compare and analyze**

Use the data in your table on the previous page to answer these questions:

- Earth is closest to the Sun when it is **winter** in the Northern Hemisphere.  
  < fall / winter / spring / summer >

- Earth is farthest from the Sun when it is **summer** in the Northern Hemisphere.  
  < fall / winter / spring / summer >

4. **Reflect**

A common belief for why we experience Seasons is that Earth is closer to the Sun in the summer, and farther away in the winter.

Do you agree or disagree with this? **disagree**  
< agree / disagree >

Explain your reasoning. If you disagree, please explain why you think we have seasons.

Earth is further away from the Sun when it is summer in the Northern Hemisphere, so this doesn’t make sense. We have seasons because the fixed tilt of the Earth results in more intense sunlight and longer days during certain periods of the orbit around the Sun.

5. **Recap**

i. What season is it for the person in the diagram to the right? **summer**  
< fall / winter / spring / summer >

ii. The person in this diagram will experience (circle one):

   a. A longer day and shorter night
   b. Roughly an equal day and night
   c. A longer night and shorter day

   < fall / winter / spring / summer >

   Sun far away in this direction

   Earth rotates this way

   Sunlight

iii. Sketch a side-view of Earth and the Sun when the Southern Hemisphere is experiencing winter.
